Nat. Struct. Biol. 4:900-903(1997).

-i- FUNCTION: GENERAL COACTIVATOR THAT FUNCTIONS COOPERATIVELY WITH TAFS AND MEDIATES FUNCTIONAL INTERACTIONS BETWEEN UPSTREAM ACTIVATORS AND THE GENERAL TRANSCRIPTIONAL MACHINERY. BINDS SINGLE-STRANDED DNA.

-i- SUBCELLULAR LOCATION: Nuclear.
-i- PTM: ACTIVITY OF P15 IS CONTROLLED BY PROTEIN FUNCTION

ASSOCIATES SPECIFICALLY WITH THE ACTIVATED FORMS OF THE G PROTEIN SUBUNITS G(I)-ALPHA AND G(Z)-ALPHA BUT FAILS TO INTERACT WITH THE STRUCTURALLY AND FUNCTIONALLY DISTINCT G(S)-ALPHA SUBUNIT. ACTIVITY ON G(Z)-ALPHA IS INHIBITED BY PALMITOYLATION OF THE G-PROTEIN (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nature 409:685-690(2001)

FUNCTION: Could coordinate an aspect of bone turnover.

SUBCELLULAR LOCATION: Secreted.

TISSUE SPECIFICITY: IN LIVER AND BONE BUT NOT IN HEART
                                                                                                                                                                                                                                                                                                                                                                                                                                 KIDNEY,

"Evi-2, a common integration site involved in murine myeloid
leukemogenesis.";

Mol. Cell. Biol. 10:4658-4666(1990).

-I- FUNCTION: MAY COMPLEX WITH ITSELF OR/AND OTHER PROTEINS WITHIN THE
MEMBRANE, TO FUNCTION AS PART OF A CELL-SURFACE RECEPTOR.

-I- SUBCELLULAR LOCATION: Type I membrane protein.

-I- DISEASE: EXPRESSION OF THIS GENE IS ALTERED BY VIRAL INTEGRATION
AND THIS ALTERED EXPRESSION MAY PREDISPOSE CELLS TO MYELOID
                                                                                                                                                                                                                                                                                                                                                                                                                            MOUSE
